Problem:

Develop a working algorithm (detailed calculation process) using Math Lab to determine the diffusivity of moisture of a couscous product as a function of temperature, moisture, and porosity based on equilibrium moisture.

GAB model coefficients for couscous flour at various temperatures:

```
Temp = [20, 35, 50, 60]+273.15;

Mo = [11.8, 6.45, 5.92, 3.53];

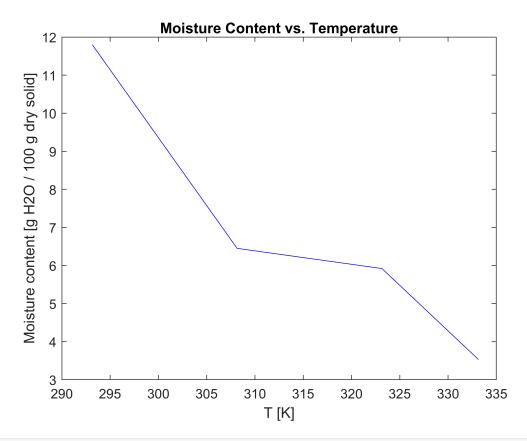

K = [0.65, 0.71, 0.72, 0.76];

C = [4.21, 8.77, 10.01];
```

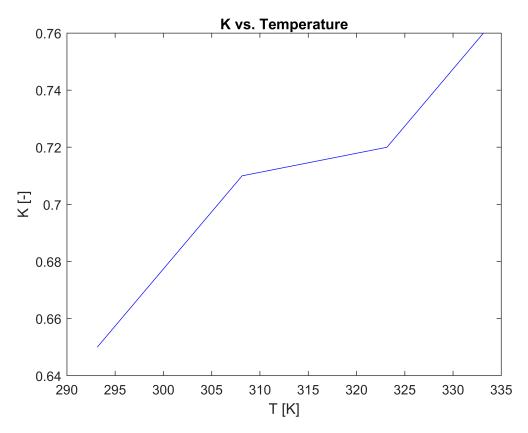

Part A: Determine the relation for moisture diffusion as a function of temperature and moisture.

Develop a GAB equation with Xm, Cg, and K as a function of temperature for your product. Plot Xm, Cg and K vs temperature. Provide a plot of X vs aw at various temperatures for your product and compare with data given above.

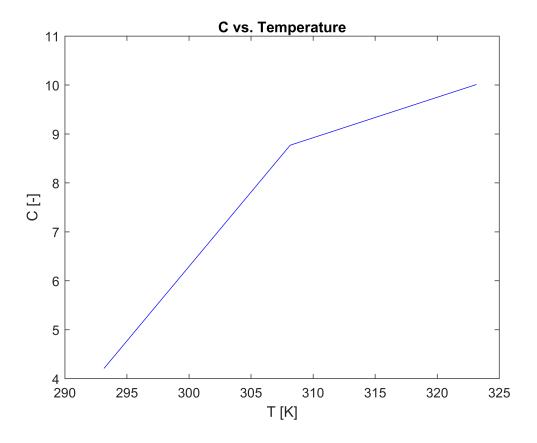

```
figure
plot(Temp, Mo);
title('Moisture Content vs. Temperature')
xlabel('T [K]')
ylabel('Moisture content [g H20 / 100 g dry solid]')
```

```
figure
plot(Temp, K);
title('K vs. Temperature')
xlabel('T [K]')
ylabel('K [-]')
```

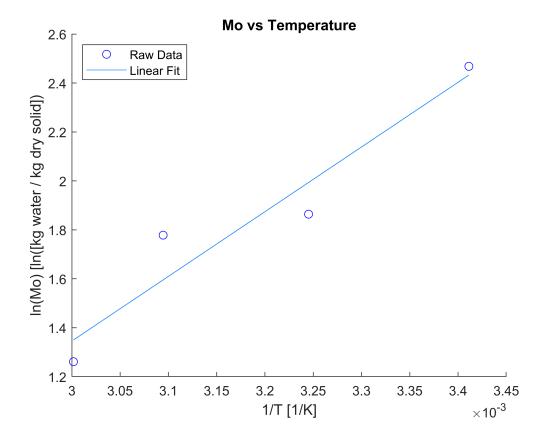

```
figure
plot(Temp(:,1:3), C);
title('C vs. Temperature')
xlabel('T [K]')
ylabel('C [-]')
```

Equation 1: $m = m_0 e^{\frac{-\Delta H_r}{RT}}$

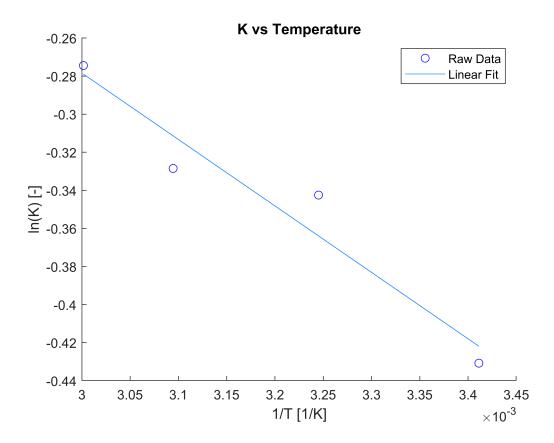

```
R = 8.314; %universal gas constant J/mol*K

figure()
hold on
scatter(1./Temp, log(Mo),'DisplayName','Raw Data');
X = [1./Temp;ones(1,length(1./Temp))];
linear_coef_mo = polyfit((1./Temp), (log(Mo)), 1);
plot(1./Temp, linear_coef_mo(2) + linear_coef_mo(1).*(1./Temp),'DisplayName','Linear Fit')
legend('show', 'Location', 'northwest');
title('Mo vs Temperature')
xlabel('1/T [1/K]');
ylabel('ln(Mo) [ln([kg water / kg dry solid])');
```

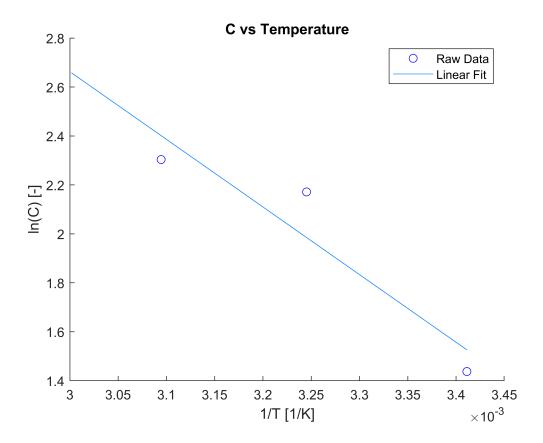

Equation 2: $k = k_0 e^{\frac{-\Delta H_p}{RT}}$

```
figure()
hold on
scatter(1./Temp, log(K), 'DisplayName', 'Raw Data');
X = [1./Temp;ones(1,length(1./Temp))];
linear_coef_K = polyfit((1./Temp), (log(K)),1);
plot(1./Temp, linear_coef_K(2) + linear_coef_K(1).*(1./Temp), 'DisplayName', 'Linear Fit')
legend('show');
title('K vs Temperature')
xlabel('1/T [1/K]');
ylabel('ln(K) [-]');
```

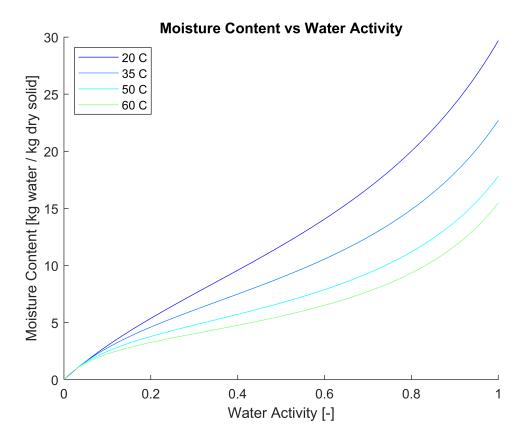

Equation 3: $c = c_0 e^{\frac{-\Delta H_c}{RT}}$

```
figure()
hold on
scatter(1./Temp(1:3), log(C), 'DisplayName', 'Raw Data');
X = [1./Temp;ones(1,length(1./Temp))];
linear_coef_C = polyfit((1./Temp(1:3)), (log(C)),1);
plot(1./Temp, linear_coef_C(2) + linear_coef_C(1).*(1./Temp), 'DisplayName', 'Linear Fit')
legend('show');
title('C vs Temperature')
xlabel('1/T [1/K]');
ylabel('ln(C) [-]');
```

Equation 4:
$$\frac{m}{m_0} = \frac{c \cdot k \cdot \alpha_w}{(1 - k \cdot \alpha_w)(1 + (c - 1)k \cdot \alpha_w)}$$

```
step = 0.00001;
aw = 0:step:1;
M_major = [];
figure()
hold on
for i = 1:length(Temp)
    Mo new = exp(linear coef mo(2))*exp(linear coef mo(1)/Temp(i));
    C_new = exp(linear_coef_C(2))*exp(linear_coef_C(1)/Temp(i));
    K_new = exp(linear_coef_K(2))*exp(linear_coef_K(1)/Temp(i));
    for j = 1:length(aw)
        M(j) = (Mo_new*C_new*K_new*aw(j))/((1-K_new*aw(j))*(1+(C_new-1)*K_new*aw(j)));
        M = M(j);
    end
    plot(aw,M)
end
title('Moisture Content vs Water Activity')

Determine Deff from Eq 48 of the Food Dehydration chapter (10). Calculate Ea, Do (liquid water), Do (vapor water), from Diffusivity data at different temperatures given Geankoplis or other literature. Use K as given in Chp 10 p 661. Compare calculated Deff with Deff values found in literature. Plot Deff vs. moisture at various temperatures and plot Deff vs. moisture at various porosities. Compare with data given in Chp 10 Table 10.7.

Equation 6:
$$D_{\text{AVeff}} = \frac{\varepsilon}{\tau} D_{\text{AV}} = \frac{\varepsilon}{\tau} \left(D_{\text{AVD}} e^{\frac{-E_c}{RT}} \right) = \frac{\varepsilon}{\tau} \left(D_{\text{AVO}} e^{\frac{-E_A}{RT}} \right) \frac{K e^{\frac{-E_b}{RT}}}{1 + K e^{\frac{-E_b}{RT}}}$$

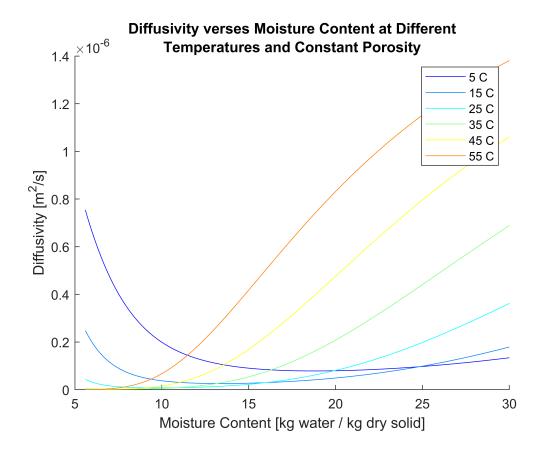

Equation 7:
$$D_{\text{ALeff}} = \frac{1-\varepsilon}{\tau} D_{\text{AL}} = \frac{1-\varepsilon}{\tau} \left(D_{\text{ALD}} e^{\frac{-E_A}{RT}} \right) = \frac{1-\varepsilon}{\tau} \left(D_{\text{ALO}} e^{\frac{-E_A}{RT}} \right) \frac{K e^{\frac{-E_b}{RT}}}{1+K e^{\frac{-E_b}{RT}}}$$

Equation 8: =
$$D_{\text{eff,series}} = \frac{\varepsilon}{\tau} D_V + \frac{1-\varepsilon}{\tau} D_L$$

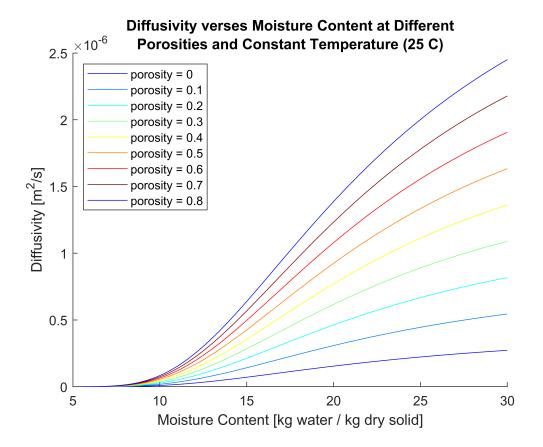

Equation 9:
$$\frac{1}{D_{\text{eff,perpendicular}}} = \frac{1}{\frac{\varepsilon}{\tau}D_V} + \frac{1}{\frac{1-\varepsilon}{\tau}D_L}$$

Equation 10: $D_{\text{eff}} = \varphi D_{\text{eff,series}} + (1 - \varphi) D_{\text{eff,perpendicular}}$

Part B: Determine the dryer operating conditions (temperature and humidity) maximize shrinkage to dehydrate the soy product form 60% H2O wb to 10% H2O wb.

Plot Tg as a funciton of moisture ocntent using the Fox equation and determine the temperature and humidity for one stage of the dryer. Tg of the soy solid is 410K and Tg of water is 134 K.

Single-Stage Dryer:

```
temp_change = Tg_10(Mc_desired*1000+1) - Tg_10(Mc_initial*1000+1);
Tg_op = Tg_original + temp_change;
Operating_Temperature = Tg_op(Mc_desired*1000+1);
Mo_temp = exp(linear_coef_mo(2))*exp(linear_coef_mo(1)/Operating_Temperature);
C_temp = exp(linear_coef_C(2))*exp(linear_coef_C(1)/Operating_Temperature);
K_temp = exp(linear_coef_K(2))*exp(linear_coef_K(1)/Operating_Temperature);
RH = (2 + ((Mo_temp/10)-1)*C_temp - ((2+(Mo_temp/10-1)*C_temp)^2 - 4*(1-C_temp))^0.5)/(2*K_temp) = RH*100;
fprintf('For a one stage dryer, the operating temperature must be %.2f K and the RH must be %.3
```

For a one stage dryer, the operating temperature must be 496.57 K and the RH must be 90.98%.

Multi-Stage Dryer
